

The Dermatlas Project:

Cross-species oncogenomics of melanoma and other malignancies to
define disease drivers

@David_J_Adams

David Adams, Experimental Cancer Genetics

Skin structures

Benign, Intermediate, Malignant

Other

Cutaneous myxoma, Non neural dermal granular cell tumour, Superficial acral fibromyxoma, Extramammary Paget disease

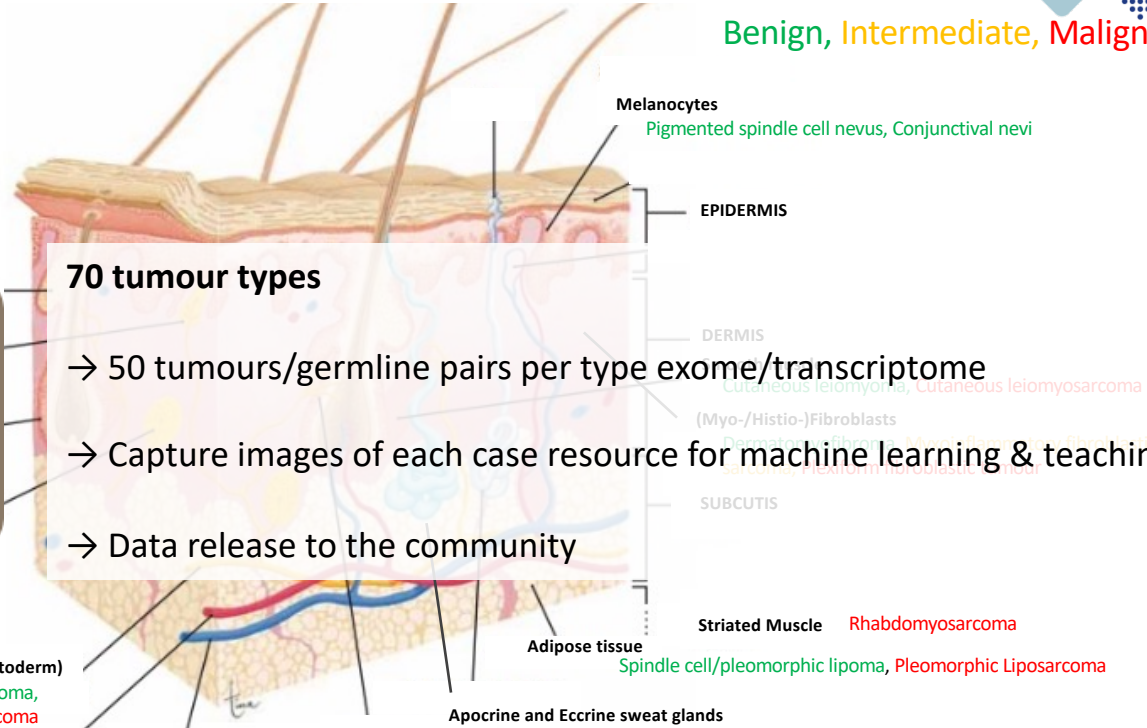

MRC | Medical Research Council

70 tumour types

→ 50 tumours/germline pairs per type exome/transcriptome

→ Capture images of each case resource for machine learning & teaching

→ Data release to the community

Glomus tumour, Angioleiomyoma, Myopericytoma, Myofibroma, Epithelioid Angiomatous Nodule, Microvenular/Hobnail/Glomeruloid/Spindle cell/Tufted Hemangioma, Atypical Vascular Lesion, Kaposiform/Retiniform hemangioendothelioma, Cutaneous (epithelioid) angiosarcoma, Malignant glomus tumour

Apocrine and Eccrine sweat glands
 Poroma, Syringoma, Hidradenoma, Mixed tumour, Myoepithelioma, Syringocystadenoma papilliferum, Hidradenoma papilliferum, Tubular apocrine adenoma, Porocarcinoma, Microcystic adnexal carcinoma, Endocrine mucin-producing sweat gland carcinoma, Digital papillary adenocarcinoma, Squamoid eccrine ductal carcinoma, Eccrine ductal carcinoma, Malignant mixed tumour, Malignant myoepithelioma, Hidradenocarcinoma, Mucinous carcinoma, Apocrine carcinoma, Cribriform carcinoma, Polymorphous sweat gland carcinoma

Somatic Mutations & Driver Genes

Germline Variants

Copy Number Alterations

Viral Sequences

Mutational Signatures

Fusion Genes

Genes expressions

ALPK1 hotspot mutation as a driver of human spiradenoma and spiradenocarcinoma

Spiradenoma

Well demarcated and encapsulated solitary nodule

Intensely basophilic

In the dermis or subcutis

Dilated blood and lymphatic vessels + lymphs

sweat gland-derived

Spiradenoma

Two cell types – clear and dark

Clear cells (centre). Dark cells (peripheral)

Ductal differentiation

Low-grade spiradenocarcinoma

Easily mistaken for spiradenoma

Loss of dual population

Monotonous epithelial cells

Mild-moderate atypia

High-grade spiradenocarcinoma

Cytological atypia

Day 4

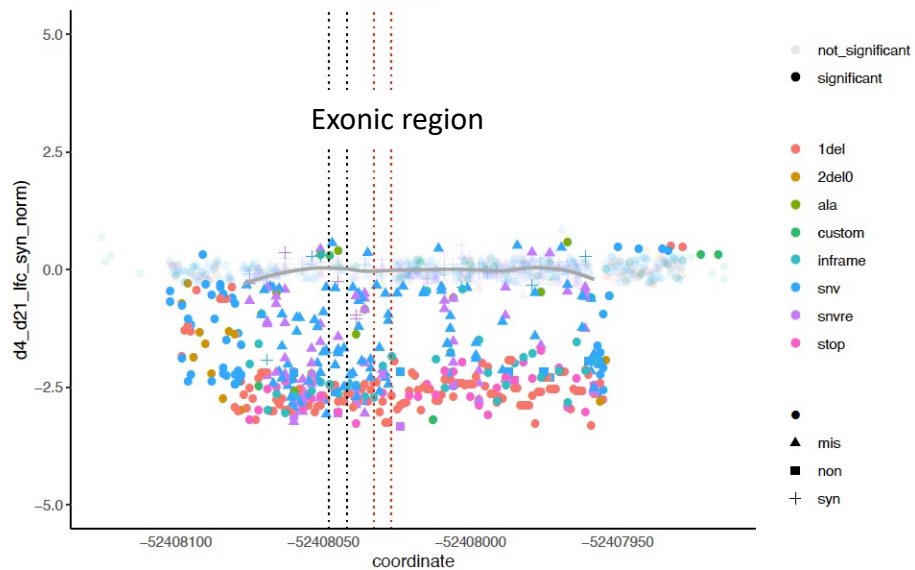

Benign

Day 21

Disruptive

Variant change between Day 4 and Day 21

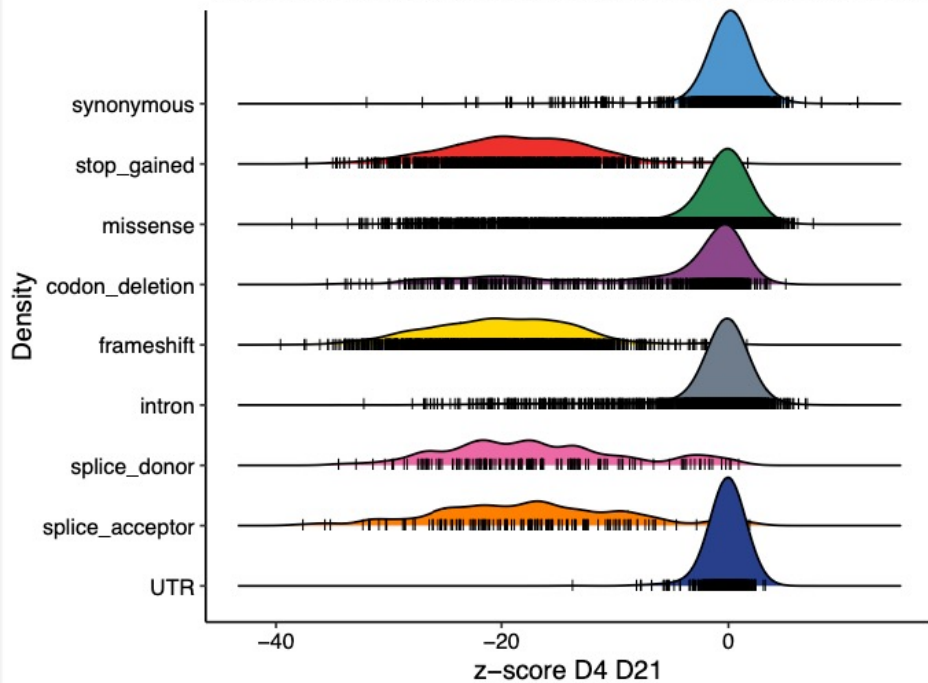

Variant Change for Different Mutational Consequences

○ z-score $p > 0.01$ ○ z-score $p < 0.01$

Variant Distribution for Different Mutational Consequences

BAP1: A clinical example

S98R is depleted in SGE assay, consistent with HA-Ub-VME assay

Benign

Disruptive

- CANONICAL_SPLICE ● NON_SYNONYMOUS ● STOP_GAINED
- INTRONIC ● SPLICE_SITE ● SYNONYMOUS
- △ depleted □ enriched ○ not significant

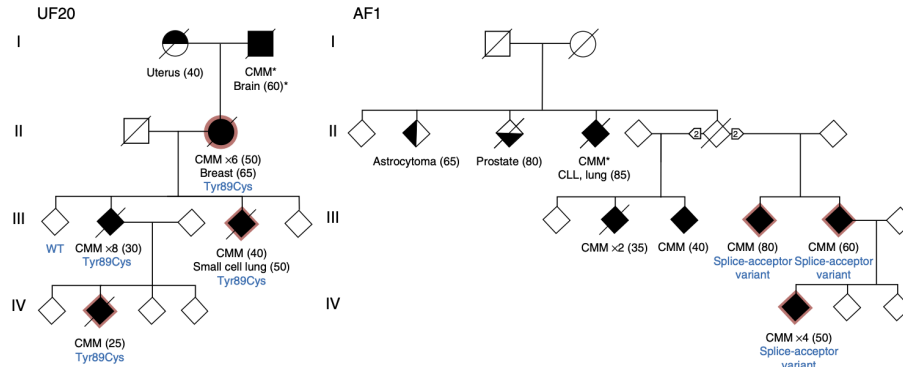

- AGC[S98]>AGA[R] & AGC[S98]>AGG[R] show strong depletion – concordant missense change
- synonymous change of AGC[S98]>AGT[S] does not deplete significantly

BAP1 enzyme activity (HA-Ub-VME) seems directly linked to viability (SGE assay)

Familial melanoma

- 10-15% (1 in 20 patients) of all melanoma patients have familial melanoma
- Melanoma predisposition genes
 - <10 **predisposition genes** known
 - Patients & relatives at risk may lack indication for genetic counselling
- **POT1**-associated germline mutations → increased risk for familial melanoma

The wide spectrum of *POT1* gene variants correlates with multiple cancer types
