Session 12: Data Visualization

May 15, 2023

9:30 AM- 12:00 PM

Overview

- ❑ The Importance of Data Visualization in Scientific Research
- ❑ The Basics of Data Visualization
- ❑ Common Mistakes in Data Visualization
- ❑ Understanding Cancer Genetic Data and Creating Effective Visualizations
- ❑ Tools and Databases related to Data Visualization
- ❑ Suggestions for Creating Publication-Ready Figures
- ❑ Q&A and Introduction of Practical Session

The Importance of Data Visualization in Scientific Research

Why do we visualize data?

'A Picture Is Worth a Thousand Words'

- Visualization can be helpful (or even essential) to represent analysis results, to formulate hypotheses and summarize theory, to explore your data so that you understand it better or outlier detection, and more.
- Scientific visuals can be essential for analyzing data, communicating experimental results and even for making surprising discoveries.
- Visualizations can reveal patterns, trends and connections in data that are difficult or impossible to find any other way
- Deficient data visuals can reduce the quality and impede the progress of scientific research.

← Data Visualization R package: **ggplot2**

What is ggplot2?

The R package **ggplot2** is based on the Grammar of Graphics (GG), which is a framework for data visualization that dissects each component of a graph into individual components, creating distinct layers. Using the GG system, we can build graphs step-by-step for flexible, customizable results.

```
ggplot(data = <DATA>) +  
  <GEOM function>(mapping=aes(<mappings>),  
    stat = <STAT>, position = <POSITION> ) +  
  <COORDINATE function> +  
  <SCALE function> +  
  <THEME function> +  
  <FACET function> +...
```

Required

Not required

To make a **ggplot**, the data and mapping layers are basic **requirements**, while the other layers are for additional customization. *The layers that are “not required” are still important to think about, but you will be able to generate a basic plot without them.*

- **Data:**
 - your data, in tidy format, will provide ingredients for your plot
 - use `dplyr` techniques to prepare data for optimal plotting format
 - usually, this means you should have one row for every observation that you want to plot
- **Aesthetics (aes)**, to make data visible
 - `x, y`: variable along the x and y axis
 - `colour`: color of geoms according to data
 - `fill`: the inside color of the geom
 - `group`: what group a geom belongs to
 - `shape`: the figure used to plot a point
 - `linetype`: the type of line used (solid, dashed, etc)
 - `size`: size scaling for an extra dimension
 - `alpha`: the transparency of the geom
- **Geometric objects** (geoms - determines the type of plot)
 - `geom_point()`: scatterplot
 - `geom_line()`: lines connecting points by increasing value of x
 - `geom_path()`: lines connecting points in sequence of appearance
 - `geom_boxplot()`: box and whiskers plot for categorical variables
 - `geom_bar()`: bar charts for categorical x axis
 - `geom_histogram()`: histogram for continuous x axis
 - `geom_violin()`: distribution kernel of data dispersion
 - `geom_smooth()`: function line based on data
- **Facets**
 - `facet_wrap()` or `facet_grid()` for small multiples
- **Statistics**
 - similar to geoms, but computed
 - show means, counts, and other statistical summaries of data
- **Coordinates** - fitting data onto a page
 - `coord_cartesian` to set limits
 - `coord_polar` for circular plots
 - `coord_map` for different map projections
- **Themes**
 - overall visual defaults
 - fonts, colors, shapes, outlines

Detailed information can be found in the following website:

<https://ggplot2.tidyverse.org/reference/index.html>

ggplot2 theme elements

ggplot2 theme elements reference

Set minimal as the baseline theme:

```
theme_minimal() +
  theme(theme.element = element_type())
```

Use `element_blank()` to remove an element

Axis titles, text, ticks, and lines can be specified per axis using theme inheritance by putting `.x/.y` at the end of the theme element.

`axis.line.y = element_line()`

`axis.title.y = element_text()`

`panel.grid.major = element_line()`

`panel.grid.minor = element_line()`

`axis.text.y`

`axis.text = element_text()`

`axis.text.x`

`text = element_text()` ← modifications will be applied to all text elements

```
plot.title.position = "plot"
plot.caption.position = "plot" } "plot" means that they will be aligned to the entire plot (instead of the panel)
plot.title = element_text()
plot.subtitle = element_text()
plot.margin = margin(25, 25, 25, 25)
```

isabella-b

Full list of elements at ggplot2.tidyverse.org/reference/theme

ggplot2 Theme Elements

```
theme(element_name = element_function())
- element_text()
- element_line()
- element_rect()
- element_blank()
```

Plot elements:

```
plot.background element_rect()
plot.title element_text()
plot.margin margin()
```

Facetting elements:

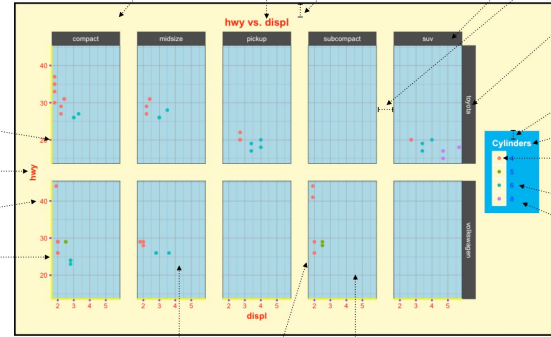

```
strip.background element_rect()
panel.spacing unit()
strip.text element_text()
```

Axis elements:

```
axis.ticks element_line()
axis.title element_text()
axis.text element_text()
axis.line element_line()
```

Legend elements:

```
legend.margin margin()
legend.title element_text()
legend.key element_rect()
legend.text element_text()
legend.background element_rect()
```

```
panel.background element_rect()
panel.grid element_line()
panel.border element_rect(fill = NA)

To the Editor

In biomedical research, it is often necessary to compare multiple data sets with different distributions. The bar plot, or histogram, is typically used to compare data sets on the basis of simple statistical measures, usually the mean with s.d. or s.e.m. However, summary statistics alone may fail to convey underlying differences in the structure of the primary data (Fig. 1a), which may in turn lead to erroneous conclusions. The box plot, also known as the box-and-whisker plot, represents both the summary statistics and the distribution of the primary data. The box plot thus enables visualization of the minimum, lower quartile, median, upper quartile and maximum of any data set (Fig. 1b). The first documented description of a box plot-like graph by Spear¹ defined a range bar to show the median and interquartile range (IQR, or middle 50%) of a data set, with whiskers extended to minimum and maximum values. The most common implementation of the box plot, as defined by Tukey², has a box that represents the IQR, with whiskers that extend 1.5 times the IQR from the box edges; it also allows for identification of outliers in the data set. Whiskers can also be defined to span the 95% central range of the data³. Other variations, including bean plots⁴ and violin plots, reveal additional details of the data distribution. These latter variants are less statistically informative but allow better visualization of the data distribution, such as bimodality (Fig. 1b), that may be hidden in a standard box plot.

<https://www.nature.com/articles/nmeth.2811>

The same three samples plotted by bar chart with s.e.m. error bars (left) and Tukey-style box plot (right). The box plot more clearly represents the underlying data.

Boxplot

Annotations/Text

Text is one of the most crucial elements of data visualization. Here are a few useful tips about using text in your data visualization:

Fonts

- Some fonts are very easy to read, **SOME CAN HURT TO READ**
- What makes a good font
 - Taller letters
 - Rounded o's, p's, d's, etc.
 - Simple, un-elaborate letter shape
- Good example fonts:
 - Roboto
 - Sans
 - Lora
 - Etc.
- More info:
 - [Choosing Fonts for Your Data Visualization](#)
 - [Which fonts to use for your charts and tables](#)

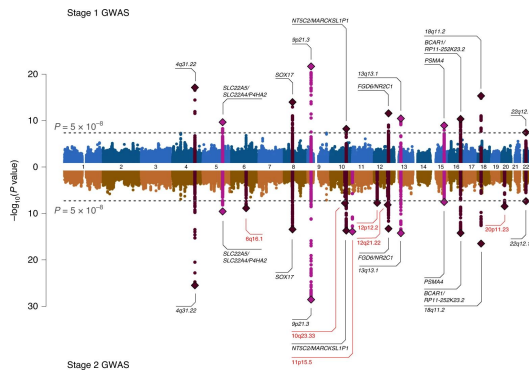

R packages: showtext/extrafont

Labels

ggrepel provides geoms for ggplot2 to repel overlapping text labels:

- [geom_text_repel\(\)](#)
- [geom_label_repel\(\)](#)

Text labels repel away from each other, away from data points, and away from edges of the plotting area.

Scales/Transformation

You can construct your own transformer using `scales::trans_new()`, but `ggplot2` understands many common transformations supplied by the `scales` package.

Name	Function $f(x)$	Inverse $f^{-1}(y)$
asn	$\tanh^{-1}(x)$	$\tanh(y)$
exp	e^x	$\log(y)$
identity	x	y
log	$\log(x)$	e^y
log10	$\log_{10}(x)$	10^y
log2	$\log_2(x)$	2^y
logit	$\log\left(\frac{x}{1-x}\right)$	$\frac{1}{1+e(y)}$
pow10	10^x	$\log_{10}(y)$
probit	$\Phi(x)$	$\Phi^{-1}(y)$
reciprocal	x^{-1}	y^{-1}
reverse	$-x$	$-y$
sqrt	$x^{1/2}$	y^2

Log2 transformation of x and y axes

Format ticks label to show exponents

Set axis into log10 scale

Show log scale ticks

Display log scale ticks mark

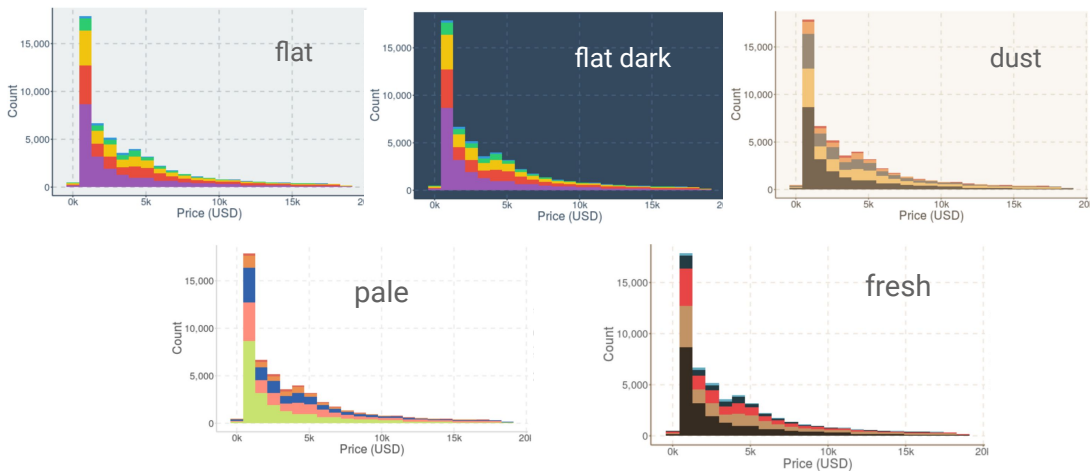

Theme

- Enhance visual appeal
- Unify visualizations
- Reinforce message/story
- Create visual hierarchy
- **Impact overall effectiveness.**

Common Mistakes in Data Visualization

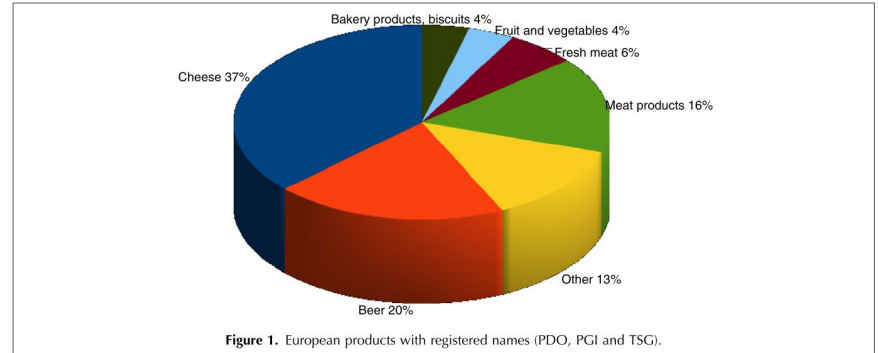

Using the wrong type of visualization for the data

A good data visualization should be done:

- Clearly
- Precisely and accurately
- Effectively and efficiently
- excluding unnecessary elements: Including unnecessary or distracting elements, such as 3D effects or excessive ornamentation, can detract from the clarity of the visualization.

To ensure you are communicating effectively, here are some important questions to ask yourself when visualizing your data:

- What do you want to communicate?
- Who is your audience?
- What is the best way to visualize your message?

An example of an ineffective visualization

What is wrong with this image? Try to answer for yourself what you think this figure is trying to communicate and whether it is successful. How could this image be improved?

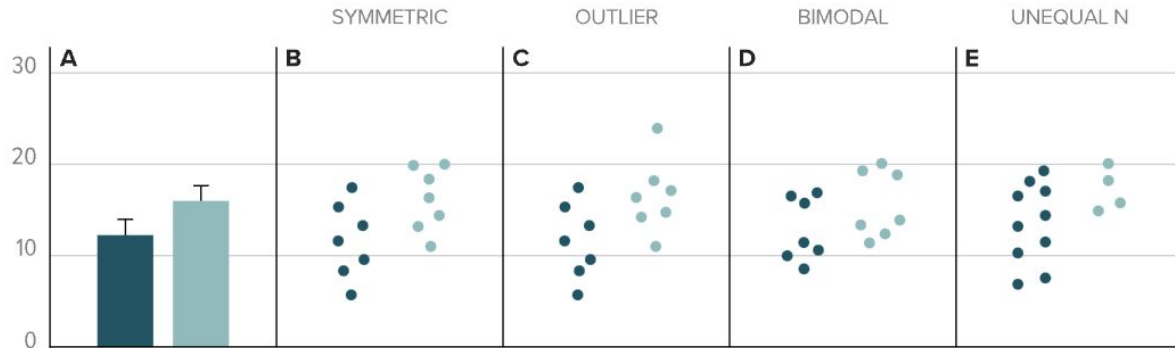

Hints: Why is this in **3D**? Which elements do your eyes **focus on** first? How does a **pie chart** visually communicate the information?

When showing comparisons, a bar chart is generally better than a pie chart. It is easier to make out the difference in length of bars than the size of pie segments.

Data may be hidden in barplots

Hidden in the bars

Data revealed in scatterplots may be masked within a bar chart.

SOURCE: T.L. WEISSGERBER *ET AL* / *PLOS BIOLOGY* 2015

5W INFOGRAPHIC / KNOWABLE

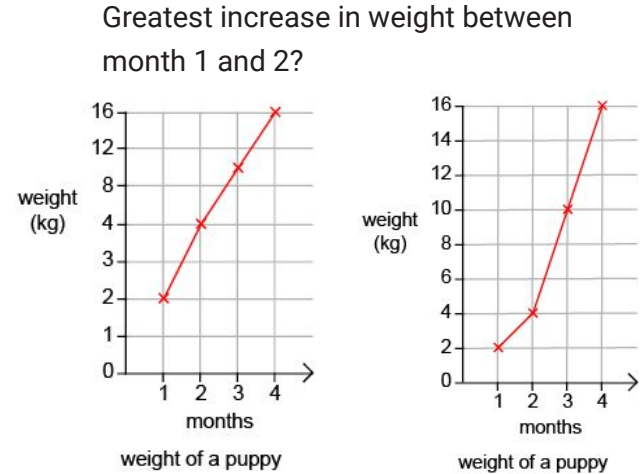

**Box plots with data points
are a more communicative
way to replace the bars**

Every one of the four sets of data on the right can be accurately represented by the same bar graph on the left, illustrating how bar graphs can obscure important details about the data, possibly misleading readers.

Using misleading scales or strong background

Tripled house price?

Avoid backgrounds that clash with the data

Avoid distracting backgrounds, which is hard for readers to focus on the data

Avoid using gridlines that are too prominent

The misuse of colour in science communication

Poorly chosen color schemes or color scales can obscure the data or create confusion

a, certain incremental data variation is either under- or strongly overrepresented with jet (a.k.a. rainbow) depending on the colour segment

Ruinous rainbows

One of the most common bad practices is using the rainbow color scale. From geology to climatology to molecular biology, researchers gravitate toward mapping their data with the help of Roy G. Biv.

But the rainbow palette has several serious drawbacks — and very little to recommend it.

Alternative color scales

SOURCE: J.R. NUÑEZ ET AL / PLOS ONE 2018

KNOWABLE MAGAZINE

A microscopic image of yeast cells rendered with different color scales highlights the counterintuitive nature of the rainbow scale. Both the viridis and cividis color scales are intended to better represent the underlying data and are easier to read. Cividis was specifically designed to be legible for color-blind people as well.

Contrast can create illusions

Contrast can create illusions

Starred boxes are an identical shade of orange, despite their appearance.

SOURCE: H.E. GRECCO ET AL. / NATURE METHODS 2010

SW INFOGRAPHIC / KNOWABLE

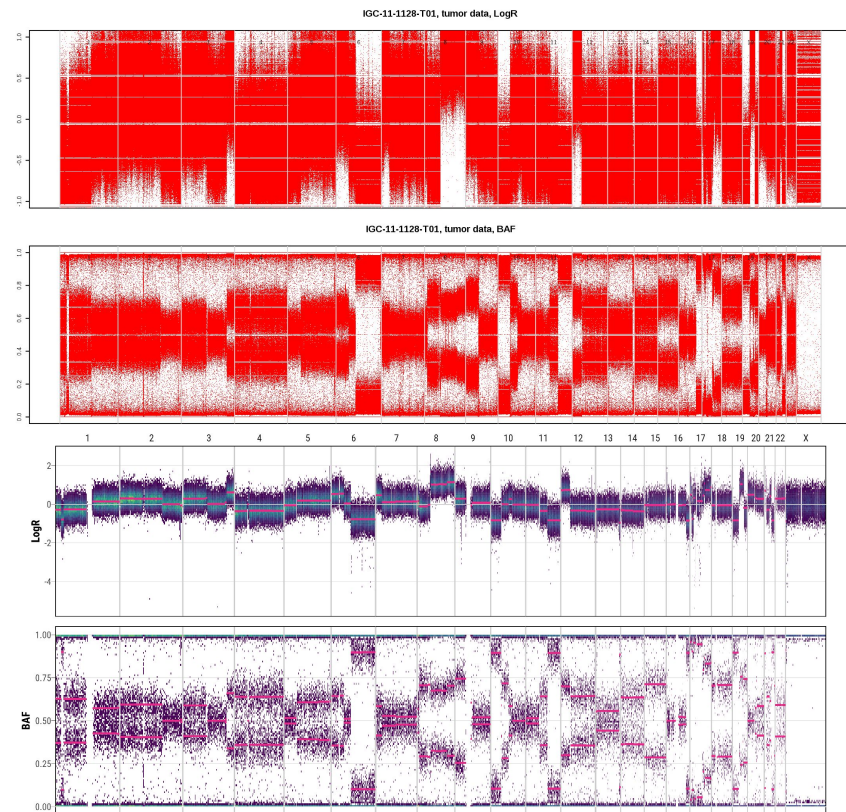

The two starred squares on this heat map are identical shades of orange, indicating identical values in terms of gene activity. But differences in the color of neighboring squares means that the starred ones don't look identical, which can be misleading.

Simultaneous contrast illusion means that the grid cell circled on the right hand side does not appear the same colour as the one on the left hand side. Also the grid cell on the right hand side does not match the legend (even though they are both in the same 1–2 category).

Cluttering the visualization

Including too much information or too many data points in a visualization can make it difficult to read and interpret.

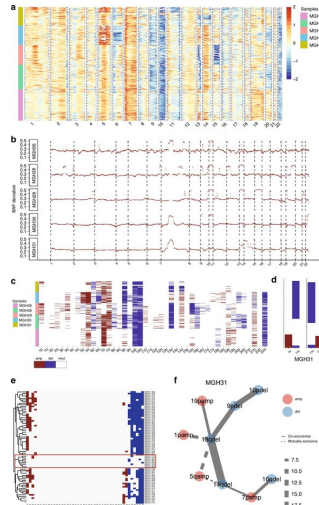

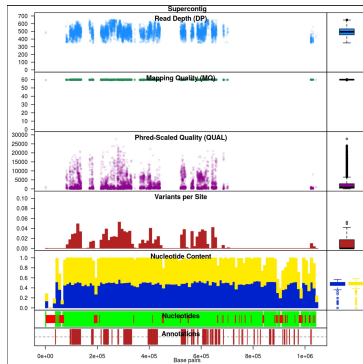

Copy number segmentation (logR + BAF)

Visualizing intersecting data by UpSet

- Use **perceptually efficient visual encodings**, i.e., make it easy to read the data accurately.
- Make it possible to not just visualize intersections, but to **visualize combinations of intersections** (e.g., all the intersections involving two particular sets).
- **Visualize attributes about the intersections**. It is not just the magnitude of an intersection that is interesting, but we also want to know whether the data associated with intersection is different or similar.

Understanding Cancer Genetics Data and Creating Effective Visualizations

Visualizing complex data

The problem has become more acute with the ever-increasing amount and complexity of scientific data. Visualization of those data – to understand as well as to share them – is more important than ever.

1. Select the appropriate visualization technique for the type of data you are working with.
2. Highlight key features using color, size, or other visual cues to make them stand out.
3. Simplify the visualization to avoid overwhelming the audience with too much detail.
4. Use interactive elements to allow the audience to explore the data in their own way.
5. Provide context by including background information and definitions to help the audience interpret the data.
6. Ensure that the visualization is accessible to the audience by using clear labels and titles that are easy to understand.

Suggestions for Creating Publication-Ready Figures

★ **Choose the right visualization technique for your data**, considering both the type of data and the message you want to convey. (you may get some ideas from other visualizations with similar data types or analysis)

★ **Keep it simple and clear:** Focus on the most important message you want to convey and remove any extraneous details or clutter that could confuse the audience. (Especially for the main figures in a manuscript)

★ **Use color effectively:** Choose a limited color palette and use color to highlight important information or patterns in the data. Avoid using too many colors or making color choices that may not be visible for people with color vision deficiencies. (Use consistent colors across all figures in the manuscript)

★ **Label everything clearly:** Provide clear and concise labels for all axes, legends, and data points to help the audience understand the figure. Use a legible font size and style that can be easily read, even when the figure is reduced in size for publication. (Keep in mind the minimal font size in the very beginning.)

★ **Consult the journal's guidelines:** Review the journal's guidelines for figures to ensure that your figure meets their requirements for size, resolution, and format. (Try to generate smaller figures with a clear message)

- ★ **Ensure reproducibility:** Provide all necessary details about the methods used to create the figure, including any software or code used. This will help other researchers to reproduce your results or build upon your work. (For R, save the entire image object for future investigation and reproduction)
- ★ **Choose the right format:** Select a format that will be suitable for publication, such as high-resolution image files or **vector graphics**. Consult the journal's guidelines or requirements to ensure you're using an appropriate format. (PDF, SVG, or EPS are all good vector graphics).
- ★ **Get feedback:** Ask colleagues or collaborators to review the figure before submitting it for publication to get feedback on its clarity and effectiveness.

For reproduce figures
>save.image (file = 'xxx')

Raster
GIF, JPEG, PNG

Vector
SVG
PDF, EPS

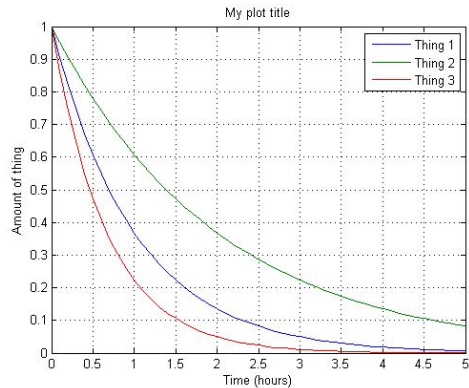

Editing Scientific figures using Adobe Illustrator ('AI')

Over figure-scripting?

Because it's a lot of trouble to fully script figures, and hardcoding everything can make it very difficult to make requested edits. Adobe Illustrator can:

- Resize images/figures
- Add scale bars
- Easily modify colors and rearrange panels
- Easily adjust aesthetics (e.g. alignment, compiling micrographs with schematics)

THANKS FOR YOUR ATTENTION!
